Description Rejetto HFS 3.0.0 through 3.2.0 derives its session-cookie signing key from the non-cryptographic Math.random() generator and discloses outputs of the same generator to unauthenticated clients during login. A remote attacker can collect a small number of login responses, reconstruct the generator's state, recover the signing key, and forge a valid administrator session cookie, leading to full administrative access and remote code execution via the server\_code configuration feature.

## Ready to get Started?

---

Explore VulnCheck, a next-generation Cyber Threat Intelligence platform, which provides exploit and vulnerability intelligence to help you prioritize and remediate vulnerabilities that matter.

-

### Vulnerability Prioritization

Prioritize vulnerabilities that matter based on the threat landscape and defer vulnerabilities that don't.

-

### Early Warning System

Real-time alerting of changes in the vulnerability landscape so that you can take action before the attacks start.
