URGENT - Subdomain Takeover on media.vine.co due to unclaimed domain pointing to AWS

Report

Hi, This is an urgent issue and I hope you will act on it likewise. Your subdomain media.vine.co is pointing to AWS S3, but no bucket was connected to it. Actually, the reason to it is due to the CNAME of the meda.vine.co-DNS-entry:

Code•71 Bytes

1media.vine.co 2 -> media.vine.co is an alias for vines.s3.amazonaws.com.

This might have worked before, since there is a bucket with the name "vines". However, these are the rules for how CNAMEs to S3 are working currently:

Customizing Amazon S3 URLs with CNAMEs

Depending on your needs, you might not want "s3.amazonaws.com" to appear on your website or service. For example, if you host your website images on Amazon S3, you might

prefer <http://images.johnsmith.net/> instead of <http://johnsmith-images.s3.amazonaws.com/>.

The bucket name must be the same as the CNAME. So <http://images.johnsmith.net/filename> would be the same as <http://images.johnsmith.net.s3.amazonaws.com/filename> if a CNAME were created to map images.johnsmith.net to images.johnsmith.net.s3.amazonaws.com.

So what happens here is actually that, since media.vine.co is pointing to S3, S3 is actually checking if there's a bucket with that name. Which in this case was not true. So I was able to claim the bucket media.vine.co and thus, can place content on this URL.

You should immediately remove the DNS-entry for media.vine.co pointing to AWS S3.

Since I have complete control over the subdomain I can do whatever I want on it. The restriction I have now is that I'm not able to serve anything on the root-URL (<http://media.vine.co/>) – however – if I would have created the bucket in the correct region (West-1) in AWS, this would've worked.

Creating a login form that would fool anyone, since it's present on a Vine.co domain.

POC-link: <http://media.vine.co/login>

POC-image attached.

This is really severe. Foolproof phishing. XSS on vine.co. Potential malware spread through a domain you – in this case – do not control. Extremely painful for the Company Brand.

Please make sure you're always going through your DNS-entries so no subdomains are pointing to external services you do not use.

We've written an advisory about this at Detectify: <http://blog.detectify.com/post/100600514143/hostile-subdomain-takeover-using-heroku-github-desk>

Where you can read more about this sort of attack.

Regards, Frans

[jcollins](#)

changed the status to ****Triaged**.

October 27, 2014, 5:51pm UTC

Thank you for your report! We believe it may be a valid security issue and will investigate it further. It could take some time to find and update the root cause for an issue, so we thank you for your patience.

Thank you for helping keep Twitter secure!

[[image: Justin]](<https://hackerone.com/jcollins>)

[jcollins](#)

closed the report and changed the status to ****Resolved**.

October 27, 2014, 6:15pm UTC

We consider this issue to be fixed now. Can you please confirm?

Thank you for helping keep Twitter secure!

October 27, 2014, 8pm UTC

Great, thank you for a confirming. A bounty amount will be awarded at the end of the week.

Thanks again!

Recovery notes

Source evidence recovered on 2026-09-14. The earlier source capture (SHA-256 `3a4ff071c043cd39676aceb47f41e7262bf9ed8b29103aa0c79f25abce5f9c22`) is no longer available. This publication uses a separately preserved capture of the same document recorded on 2026-08-07 (SHA-256 `a059b286a5f6adcd5abcedd0f94f2d12492f3df7a7278490263f1d2c1279efe5`). The retained article text was checked against this replacement capture. All retained report and timeline text matches, including S3 bucket/CNAME mismatch, region caveat, triage, confirmed DNS removal and disclosure. Existing capture-quality limitations remain recorded separately. The missing earlier capture remains documented in the archive history.
